for Enterprise
Solid-State Drive
(SSD) Technology

Offering New Internal Enterprise Solid-States Drive for Performance Redefined.

Enterprise Solid-State Drive (SSD) Technology is pioneering the way to new levels of system price performance. It is now well recognized that SSD's are capable of delivering blistering IOPS (Input/output Operations Per Second) performance versus traditional rotating disk drives in server and storage applications. This enormous gap in capability requires that different metrics need to be used to determine the affordability of SSD. Reducing foot print and energy consumption, SSD technology not only breaks through I/O performance barriers, but also helps minimize costs.

With SSD built onto the foundation of IBM Power Systems™, IBM continue to excel in the industry leadership for performance henceforth over the last five years 3,583 migrations from competitive UNIX systems to Power and over 1,000 migrations in just 2010 alone. IBM is once again named the market share leader by revenue in the UNIX® server market by IDC¹ in Q2 2011.

Limited time offer till 31st December 2011

For more information, please contact your local IBM Power Systems representative or Business Partner.
