Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

Product Guide
March 2009

IBM System x3650 M2

Product Overview

Flagship 2U server packed with innovation

Suggested Uses: All sectors requiring highly available, energy-efficient, rack-optimized solution for physical and virtual intensive commercial environments like eBusiness/eCommerce, collaboration, virtualization, database, and enterprise resource planning applications.

Your challenge is to do more with less—serve more Web pages, handle more secure connections, support more e-mail users. You need to reduce the costs of doing business and improve the service you deliver to your customers while lowering your overall risk. The dual-socket IBM® System x3650 M2 can reduce your costs with its new energy smart design. It can improve service with reduced operational complexity and increased management functionality. It will lower your IT risk with the resiliency that comes from no single point of failure. And like all IBM servers, the x3650 M2 offers you the trust that comes from the IBM global reach, service and support.

The x3650 M2 is not simply an upgrade to a previous server. It is one of our new generation of X-Architecture servers. It is a game-changing, completely redesigned rack server using significantly less power with unified systems management tools, leadership reliability, availability, serviceability features and broad system flexibility, housed in a compact 2U mechanical package.

The x3650 M2 is not simply an upgrade to a previous server. It is one of our new generation of X-Architecture servers. It is a game-changing, completely redesigned rack server using significantly less power with unified systems management tools, leadership reliability, availability, serviceability features and broad system flexibility, housed in a compact 2U mechanical package.

The x3650 M2 features Intel® Xeon® 5500 Series Processors, and either 8MB or 4MB of shared cache, to help provide you with the computing power you need to match your business needs and growth. This new line of Intel processors delivers unprecedented intelligent performance with features like adaptive performance for applications and environments, turbo boost and hyper-threading technology, and integrated power gates and automated power management.

The x3650M2 uses up to 16 DIMMs with 128GB of registered 1333MHz DDR3 memory with Chipkill™ ECC (Error Checking and Correcting) protection—for high performance and reliability. For even higher levels of availability, the x3650M2 also offers online memory mirroring. Up to 4 integrated high-speed Gigabit Ethernet controllers with TOE (TCP Offload Engine) and Jumbo Frame support are available, as are four high-performance adapter slots (PCIe x8). The x3650M2 offers an optional embedded hypervisor to manage your virtual workloads.

The System x3650 M2 offers a choice of up to twelve high-performance hot-swap hard disk drives with an internal storage capacity of 3.6TB (twelve 2.5-inch hot-swap Serial-Attached SCSI (SAS) or SATA HDDs) Optional solid-state drives are also available to keep power low and improve resiliency and offer up to 600GB of storage. Alternatively, up to eight HDDs or SSD and one internal tape drive can be used. The server supports a choice of four IBM ServeRAID® storage controllers which provide broad levels of hardware-based RAID solutions. The ultra-dense 2U form factor allows businesses to increase their computing power and spread their workload without outgrowing their current data center. Up to 21 of these 2U servers can be installed in a single 42U rack, for a total of up to 42 processors and 168 processor cores, offering tremendous deployment flexibility. Optional Advanced Connectivity Technology (ACT) interconnect cabling reduces cable clutter and cost and minimizes installation time when interconnecting many rack-mounted servers.

Standard in the x3650 M2 is the Integrated Management Module (IMM) that enables the user to manage and control the server easily—both locally and remotely. In conjunction with the IMM, the x3650 M2 comes with a Bosch BMP085 altitude sensor (altimeter), which governs fan rotation based on altitude to help lower your energy consumption. The IMM offers a high level of manageability that is designed to keep costs down and the system up—even when network usage increases. IBM’s innovative pop-out/drop-down light path diagnostics panel enables quick servicing of the system if a problem develops. These advanced features help maximize network availability by increasing uptime, as do hot-swap solid-state drives; hot-swap/redundant SAS or SATA HDDs, redundant ultra-efficient power supplies and fans; Active Memory™, integrated RAID; temperature-controlled fans with Calibrated Vectored

...
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

**Selling Features**

The x3650 M2 offers numerous features to boost performance and reduce costs:

- **Up to two 4-core Xeon 5500 Series processors and 8MB or 4MB of shared cache per processor**, offer superior performance capable of tackling the toughest jobs. **64-bit extensions** provide the flexibility to run 32-bit and 64-bit applications concurrently. Xeon 5500 series processors offer up to 225% better performance than the previous-generation 5400 series processors and up to 900% better performance than the single-core processors of a few years ago that you may still be using.

- **Low-voltage processors** draw less energy and produce less waste heat than high-voltage processors, thus helping to reduce data center energy costs. Some 4-core Xeon 5500 Series processors use only 60W. This is less than half the wattage consumed by older 130W processors.

- Sixteen DIMMs of ultra-fast registered 1333MHz DDR3 ECC memory with Chipkill™ protection (optional) provides speed, high availability, and a memory capacity of up 128GB.

- Optional 32GB and 50GB solid-state drives (SSD) use only 2W of power per drive, vs. 9-10W for 2.5-inch HDDs. This is as much as 80% less power than a 2.5 inch HDD would use (with a corresponding reduction in heat output).

- The x3650 M2 is a leader in server resiliency. With hot-swap power supplies, fans, and storage, the x3650 M2 has no single point of failure.

- The altimeter works in conjunction with IMM to govern fan rotation based on the readings which it delivers to save money under normal conditions because the fans do not have to spin at high speed.

- **Four high-speed PCIe x8 adapters (Gen 2) slots** offer investment protection by supporting high-performance adapters, such as 10Gb Ethernet, Fibre Channel and InfiniBand cards, none of which will run in older 33MHz and 66MHz conventional PCI slots.

- Integrated ServeRAID-BR10i provides RAID-0/1/10 support without consuming a valuable adapter slot. RAID-0/1/10 offers improved disk performance via data striping; RAID-1 offers disk mirroring for high availability, and RAID-10 combines the benefits of speed and availability. The x3650 M2 also supports full RAID-0/1/10E/5/6 using the optional ServeRAID-MR10i card. It also offers higher performance, due to the 256MB battery-backed onboard cache.

- Up to twelve 2.5-inch hot-swap SAS hard disk drives offer high-performance with high availability. The SAS controller provides full-duplex (bidirectional 300MBps) data transfers for SAS drives.

- The integrated dual Gigabit Ethernet controllers with IPMI 2.0 support provide high-speed network communications. Jumbo Frames offer higher efficiency transfers for large data packets. Two more NICS can be supported on the planar with an additional Dual Port GbE daughter card. The TCP Offload Engine (TOE) feature offers higher performance for TCP/IP traffic, with less overhead on the system processor.

- A high degree of device integration—including hot swap SAS/SATA HDDs or SSD drives, multiple hardware based ServeRAID options, up to four Gigabit Ethernet ports, systems management and video controllers—lowers costs and frees up valuable adapter slots.

**Flexibility**

The x3650 M2 has the ability to grow with your application requirements, thanks to

- A choice of quad-core or dual-core processors with 1.86 to 2.93GHz clock rates, up to 6.4 gigatransfers per second, and 60W to 95W maximum power draw.

---

1 All models require Chipkill-enabled DIMMs (provided standard) for Chipkill protection.
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

- Up to 128GB of high-speed fully-buffered DDR3 system memory.
- Four available high-performance PCIe x8 adapter slots in all models. Optionally, if desired, riser cards supporting two PCI-X/133 adapters can be exchanged for the PCIe slots.
- Installing the ServeRAID-MR10i option upgrades the basic ServeRAID functionality controller with 256MB of low-cost, battery-backed cache to enable even higher-performance hardware RAID support, and allows the x3650 M2 to offer six RAID levels: RAID-0, 1, 10, 5 and 6. The optional ServeRAID-MR10M controller supports up to four IBM System Storage™ EXP3000 expansion units containing up to 48 SAS HDDs and 14.4TB of external storage.
- The four USB 2.0 ports (two front, two rear) are up to 40X faster than older USB 1.1 ports. This provides speedy access to external HDDs (non-arrayed), optical drives, tape drives, and other USB devices. Two ports are on the front of the unit and two are on the back.
- A choice of up to twelve 2.5-inch hot-swap SAS/SATA HDDs or solid-state drives, or eight 2.5-inch drives and one internal tape drive, offer a variety of storage options. The SAS and SATA models provide a maximum of 3.6TB of internal hot-swap storage.
- Alternatively, iSCSI or Fibre Channel-attached storage can be attached using IBM System Storage™ servers.

Manageability

Powerful systems management features simplify local and remote management of the x3650 M2:
- The x3650 M2 includes the IMM to monitor server availability, perform Predictive Failure Analysis, etc., and trigger IBM Systems Director alerts. The IMM enables service personnel to use sophisticated diagnostic tools, such as light path diagnostics, to resolve problems quickly.
- Integrated industry-standard Unified Extensible Firmware Interface (UEFI) next-generation BIOS. New capabilities include:
  - Human readable event logs – no more beep codes
  - Complete setup solution by allowing adapter configuration function to be moved into UEFI
  - Complete out-of-band coverage by Advance Settings Utility to simplify remote setup
- Integrated Trusted Platform Module (TPM) 1.2 support.
- Integrated IPMI 2.0 support alerts IBM Systems Director to anomalous environmental factors, such as voltage and thermal conditions. It also supports highly secure remote power control using data encryption.
- IBM Systems Director Active Energy Manager™, an IBM-exclusive, is designed to take advantage of new system power management features, by providing power monitoring and power capping features.
- Text Console Redirection support allows the administrator to remotely view x3650 M2 text messages over Serial or LAN.
- The completely redesigned IBM Systems Director is included for proactive systems management. IBM Systems Director comes with a portfolio of tools, including Management Processor Assistant, Rack Manager, RAID Manager, Update Assistant and Software Distribution. In addition, IBM Systems Director offers extended systems management tools for additional server management and increased availability. When a problem is encountered, IBM Systems Director can issue administrator alerts via e-mail, pager, and other methods.
- An optional Virtual Media Key provides additional systems management capabilities, including Web-based out-of-band control; virtual floppy and optical drive support; Windows "blue screen" error capture; LDAP and SSL support; and remote redirection of PCI video, text, keyboard and mouse. And it does all this without consuming a valuable adapter slot.

Availability and Serviceability

The System x3650 M2 provides many features to simplify serviceability and increase system uptime:
- x3650 M2 servers use Chipkill ECC memory protection. Chipkill memory is up to 16X better than standard ECC memory at correcting memory errors. This can help reduce downtime caused by memory errors.
- The x3650 M2 offers memory mirroring for redundancy in the event of a non-correctable memory failure
- Toolless cover removal provides easy access to upgrades and serviceable parts. Similarly,

2 Data transfer rates may be less than the maximum possible.
3 Chipkill protection is supported with x4 DDR-3 DIMMs, but not x8 DIMMs.
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

the Virtual Media Key and the ServeRAID-BR10i controller can be installed and replaced without tools. This means less time (and therefore less money) spent servicing the x3650 M2. Similarly, hot-swap/redundant HDDs, fans and power supplies, as well as online mirrored memory, mean greater system uptime while these components are being serviced.

- New toolless slides ship with the server, together with a Cable Management Arm (CMA), that allows the rack server to easily slide into place
- IBM Thermal Diagnostics allows the administrator to evaluate thermal data on the server without taking the hardware offline. This can provide greater server uptime.
- The drop-down light path diagnostics panel and individual light path LEDs quickly lead the technician to failed (or failing) components. This simplifies servicing, speeds up problem resolution and helps improve network availability.
- Integrated RAID-1 disk mirroring and RAID-10 striped mirrored arrays standard enable the server to keep operating in the event of a failure to any one drive.
- IPMI 2.0 supports highly secure remote system power control using data encryption. This allows an administrator to restart a server without having to visit it in person, saving travel time and getting the server back up and running quickly and securely. It also adds new features to those provided by IPMI 1.5, including VLAN support, Serial over LAN, enhanced authentication and encryption algorithms (RMCP+, SHA-1, AES) and a firmware firewall.
- Altitude- and temperature-controlled fans adjust to compensate for changing thermal characteristics. At the lower speeds they draw less power and suffer less wear. Equally important in a crowded data center, temperature-controlled fans produce less ambient noise in the data center than if they were constantly running at full speed.
- The three-year (parts and labor) limited onsite warranty\(^4\) helps afford you peace of mind and greater investment protection than a one-year warranty does.

</tbody>
</table>

With the Xeon 5500 Series processors, Intel has diverged from its traditional Symmetric Multiprocessing (SMP) architecture to a Non-Uniform Memory Access (NUMA) architecture. The Xeon 5500 processors are connected through a serial coherency link called QuickPath Interconnect (QPI). QPI is capable of 6.4, 5.8 or 4.8 GT/s (gigatransfers per second), depending on the processor model.

Dual-core Xeon processors contain two complete processor cores; quad-core processors, similarly, contain four cores. Some processors contain one unified cache shared by all cores, while other processors have multiple independent caches (one per pair of cores). The shared cache is dynamically allocated between the cores as needed. The multiple cores appear to software as multiple physical processors. The dual-core processors offer considerably higher performance than a same-speed Xeon processor with a single core. Likewise, quad-core processors offer considerably higher performance than a same-speed Xeon processor with dual cores.

Turbo Boost Technology dynamically turns off unused processor cores and increases the clock speed of the cores in use, by up to two model frequencies. For example, with three cores active, a 2.26GHz processor can run the cores at 2.4GHz. With only one or two cores active, the same

---

\(^4\) For terms and conditions or copies of the IBM Statement of Limited Warranty, call 800-772-2227 in the U.S. In Canada call 800-426-2255. Telephone support may be subject to additional charges. For warranties including onsite labor, a technician is sent after IBM attempts to resolve the problem remotely. International warranty service is available in any country in which this product is sold.

Please see the Legal Information section for important notices and information.
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

Processor can run those cores at 2.53GHz. Similarly, a 2.93GHz processor can run at 3.06GHz or even 3.33GHz. When the cores are needed again, they are dynamically turned back on and the processor frequency is adjusted accordingly.

Intel Extended Memory 64 Technology (EM64T) 64-bit extensions allow the Xeon processor to use large memory addressing when running with a 64-bit operating system. This in turn lets individual software processes directly access more than 4GB of RAM, which was the limit of 32-bit addressing. This can result in much higher performance for certain kinds of programs, such as database management and CAD. Additional registers and instructions (SSE3) can further boost performance for applications written to use them. Contact your software provider to determine their software support for EM64T.

**Execute Disable Bit** functionality can help prevent certain classes of malicious buffer overflow attacks when combined with a supporting operating system.

**Intelligent Power Capability** powers individual processor elements on and off as needed, to reduce power draw.

DDR-3 Registered Memory with Chipkill ECC Protection

The x3650 M2 ships with registered double data rate III (DDR-3) memory and provides Active Memory features, including advanced Chipkill memory protection (optionally), for up to 16X better error correction than standard ECC memory. In addition to offering better performance than DDR-2 or fully-buffered memory, DDR-3 memory also uses less energy. DDR-2 memory already offered up to 37% lower energy use than fully buffered memory. Now, a generation later, DDR-3 memory is even more efficient, using 22% less energy than DDR-2 memory.

The x3650 M2 supports up to 128GB of memory in sixteen DIMM slots. Redesign in the architecture of the Xeon 5500 series processors bring radical changes in the way memory works in these servers. For example, the Xeon 5500 series processor integrates the memory controller inside the processor, resulting in two memory controllers in a 2-socket system. Each memory controller has three memory channels. Depending on the type of memory, population of memory, and processor model, the memory may be clocked at 1333MHz, 1066MHz or 800MHz.

Note: If only one processor is installed, only the first eight DIMM slots can be used. Adding a second processor not only doubles the amount of memory available for use, but also doubles the number of memory controllers, thus doubling the system memory bandwidth. If you add a second processor, but no additional memory for the second processor, the second processor has to access the memory from the first processor “remotely,” resulting in longer latencies and lower performance. The latency to access remote memory is almost 75% higher than local memory access. So, the goal should be to always populate both processors with memory.

The X55xx models support up to 1333MHz memory clock speed, while the E55xx-and-up and L55xx-and-up models support up to 1066MHz clock speed, and the E550x models support 800MHz clock speed. Using 1333MHz memory (where supported) versus 1066MHz offers up to 9% better performance, while 1066MHz memory produces up to 28% better performance than 800MHz memory.

Xeon 5550 series processors access memory with almost 50% lower latency than the previous generation 5400 series processors. That can result in faster processing of latency-sensitive workloads.

This new processor design comes with some trade-offs in memory capacity, performance, and cost: For example, greater memory capacity comes with lower memory speed. Alternatively, it...
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

is possible to achieve the same memory capacity at lower cost but at a lower memory speed.

Regardless of memory speed, the Xeon 5500 platform represents a significant improvement in memory bandwidth over the previous Xeon 5400 platform. At 1333MHz, the improvement is almost 500% over the previous generation. This huge improvement is mainly due to the dual integrated memory controllers and faster DDR-3 1333MHz memory. Throughput at 800MHz is 25 gigabytes per second (GBps); at 1066MHz it’s 32GBps; and at 1333MHz it’s 35GBps. This improvement translates into improved application performance and scalability.

Memory interleaving refers to how physical memory is interleaved across the physical DIMMs. A balanced system provides the best interleaving. A Xeon 5500 processor-based system is balanced when all memory channels on a socket have the same amount of memory.

A memory rank is simply a segment of memory that is addressed by a specific address bit. DIMMs typically have 1, 2 or 4 memory ranks, as indicated by their size designation.

- A typical memory DIMM description is 2GB 4Rx8 DIMM
- The 4R designator is the rank count for this particular DIMM (R for rank = 4)
- The x8 designator is the data width of the rank

It is important to ensure that DIMMs with appropriate number of ranks are populated in each channel for optimal performance. Whenever possible, it is recommended to use dual-rank DIMMs in the system. Dual-rank DIMMs offer better interleaving and hence better performance than single-rank DIMMs. For instance, a system populated with six 2GB dual-rank DIMMs outperforms a system populated with six 2GB single-rank DIMMs by 7% for SPECjbb2005. Dual-rank DIMMs are also better than quad-rank DIMMs because quad-rank DIMMs will cause the memory speed to be down-clocked.

Another important guideline is to populate equivalent ranks per channel. For instance, mixing one single-rank DIMM and one dual-rank DIMM in a channel should be avoided.

Note: It is important to ensure that all three memory channels in each processor are populated. The relative memory bandwidth decreases as the number of channels populated decreases. This is because the bandwidth of all the memory channels is utilized to support the capability of the processor. So, as the channels are decreased, the burden to support the requisite bandwidth is increased on the remaining channels, causing them to become a bottleneck.

For increased availability, the x3650 M2 offers an additional (but mutually exclusive) level of IBM Active Memory protection: online memory mirroring.

Memory mirroring works much like disk mirroring. The total memory is divided into two channels. Data is written concurrently to both channels. If a DIMM fails in one of the DIMMs in the primary channel, it is instantly disabled and the mirrored (backup) memory in the other channel becomes active (primary) until the failing DIMM is replaced. One-half of total memory is available for use with mirroring enabled. (Note: Due to the double writes to memory, performance is affected.)

Mirroring is handled at the hardware level; no operating system support is required.

DDR-3 memory is available in 1GB, 2GB, 4GB and 8GB DIMMs. DIMMs are installed individually (not in pairs).

Drive Bays
The x3650 M2 contains twelve drive bays in all. Hot-swap drives may be inserted or removed through the front of the server without powering off the system. Simple-swap solid-state drives can be inserted or removed through the front of the server as well; however, the system power must first be turned off.

For additional storage, a direct-attach, NAS or SAN external expansion option can be added, using an optional controller.

A 24X/24X/24X/8X\(^5\) speed (ultraslim, 0.5") CD-RW/DVD-ROM Combo drive with an IDE interface ships standard in all x3650 M2 servers. No diskette drive is supplied with any model; an external USB floppy drive may be used, if needed.

Disk Controllers
All SAS-equipped x3650 M2 models include an integrated hardware based ServeRAID-BR10i SAS/SATA controller. This controller supports up to twelve internal SAS, SATA or solid-state drives.

The integrated ServeRAID-BR10i controller offers hardware RAID-0/1/1E support. The controller provides data transfer speeds of up to 3Gbps\(^6\) per SAS port on an 8-lane 2.5 Gbps PCIe card. It connects to both SAS and SATA HDDs, SSDs and tape drives.

---

\(^5\) Variable read rate. Actual playback speed varies and is often less than the maximum possible.

\(^6\) Data transfer rates depend on many factors and are often less than the maximum possible.
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

The x3650 M2 also supports full RAID-0/1/10/1E/5/6 support using the optional ServeRAID-MR10i card. It also offers higher performance, due to the 256MB battery-backed onboard cache.

The x3650 M2 also supports hardware based full disk encryption with RAID-0/1/10/1E/5/6 support using the optional ServeRAID-MR10is card.

For external storage, the ServeRAID-MR10M controller enables connection to up to four IBM System Storage EXP3000 SAS expansion units (48 HDDs total). It provides RAID-0/1/10/5/50 support and 256MB of onboard cache.

Additional external storage is available.

### HDD Storage Capacity

The x3650 M2 offers a flexibility with up to twelve (12) 2.5" HDD bays; optimal price/performance disk drives that provide ultimate drive density and allow you to scale up as your business grows.

- Support for 12 300GB SAS hot-swap HDDs — 3.6TB total internal storage
- Support for 12 300GB SATA hot-swap HDDs — 3.6TB total internal storage (500GB SATA HDD planned 3Q09)
- Support for 12 solid-state drives (SSDs) — 32GB or 50GB capacity— 600GB total internal storage
  - 32GB SSD — Slim FF (2.5") hot-swap or simple-swap drives
  - 50GB SSD — Slim FF (2.5") high IOPS hot-swap or simple-swap drives

### High I/O Performance

- Up to 8X IOPS more than HDDs (67/33% Read/Write OLTP transaction base mix)
- Optimized for heavy mix of Read and Write operations such as transaction processing
- Media Streaming, Surveillance, File Copy, Logging, Backup/Recovery, Business Intelligence

### Lower Cost IOPS Performance

- Yields better $/IOPS: lower capacity (GB) required to achieve higher IOPS
- Utilizes Less power and heat than conventional disk drive

### Superior Uptime

- 3X the availability of mechanical drives with RAID-1
- No moving parts to fail
- Enterprise wear-leveling to extend life even further

### Flexible Deployment with full OS support

- Traditional HDD form factor offerings
- Supports Linux, Windows and VMware

2.5-inch drives not only require less space than 3.5-inch drives, they weigh less, consume half the power, produce less noise, seek faster, and offer increased reliability.

The hot-swap SAS drives use the Converged Tray for interchangeability with other IBM System x® systems. If you need more storage space, terabyte capacities are possible with external direct-attach, NAS and SAN solutions.

### High-Performance Adapter Slots

The x3650 M2 provides four x8 (“by 8”) 5GBps PCIe (PCI Express) Gen 2 high performance I/O slots that the double performance vs. the x3650 for added long-term investment protection (2 PCI x16 Gen 2 slots optional via riser cards). Each is capable of supporting x1/x4/x8 adapters at full speed. One slot is full height, half length. The other is low profile.

- Four (4) PCIe Gen 2 slots
  - 2 x8-full-height, half-length,
  - Convertible to one PCI-X/133 MHz with riser option
  - 1 x8 full height, half length
  - 1 x8 low profile
  - Convertible to one PCI-X133 MHz with riser option

- All new adapter development is on PCI Express
- Example: no 8GB fibre for PCI-X
- Good for digital media, 2D graphics environments

Please see the Legal Information section for important notices and information.
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

PCI Express is a high-performance, low-latency, next-generation serial I/O bus that is rapidly replacing the older parallel PCI and PCI-X buses. A x16 PCIe adapter offers approximately eight times the maximum throughput of a 133MHz PCI-X adapter. (A x1 adapter offers throughput similar to a 66MHz PCI-X slot.)

There is a built-in riser card in the x3650 M2 that provides a PCIe connector (physical x8 connector wired with x4 lanes) for an internal RAID card (ServeRAID-MR10i) plus one USB connector reserved for an internal USB flash memory key to support a virtualization hypervisor.

Dual Gigabit Ethernet Controllers

The x3650 M2 includes two integrated Broadcom 5709 Gigabit Ethernet controllers for up to 10X higher maximum throughput than a 10/100 Ethernet controller, as well as support for Jumbo Frames and TOE (TCP Offload Engine).

Jumbo Frames—those larger than the standard frame (packet) size of 1,500 bytes—can be more efficient, dramatically increasing network performance and reducing server CPU overhead. TOE helps improve overall system performance by offloading TCP/IP protocol processing from the system microprocessor to the onboard Ethernet TOE processor. There is no additional charge for this capability.

It also supports highly secure remote power management using IPMI 2.0, plus Wake on LAN® and PXE (Preboot Execution Environment) flash interface. Optional PCI adapters offering failover and load balancing between adapters are available for added throughput and increased system availability.

Integrated Quad GbE ports via Broadcom 5709 GbE Controller:

- Up to four (4) GbE ports, ideal for virtualization and I/O-intensive workloads
- 2 ports standard plus two additional ports optional via adapter card
- Improves system performance by offloading protocol processing from CPU to a separate TOE engine
- Primary performance improvement for data copying (CPU) where CPU utilization is 90-100%
- The embedded NIC/TOE supports software iSCSI using a Microsoft iSCSI initiator
- Using a software initiator enables offloading the processing of TCP frames with the TOE engine in the adapter card, but the processing of iSCSI packets themselves is not hardware-offloaded at the Broadcom NIC
- Broadcom hardware-offloaded iSCSI (using TOE engine) of the iSCSI frames
- iSCSI and RDMA are not supported

Two Broadcom 5709 Gigabit Ethernet Controllers (one on-board and one on optional daughter card) provide four Gigabit ports supporting IEEE 802.3 for 1000Base-T, 100Base-TX, and 10Base-T applications (802.3, 802.3u, 802.3ab) through a RJ-45 connector to an Ethernet network over a CAT 5 twisted-pair cable. This controller supports PXE 2.0 remote boot, TCP/IP Offload Engine (TOE), Internet SCSI (iSCSI), Remote Direct Memory Access (RDMA), and jumbo frames (9KB). Licence key will be required to enable iSCSI and RDMA feature. There are two green LEDs on the connector: Activity LED on the upper left side and Link Status LED on the upper right side (viewed facing the connector). TOE support on Windows is available today. But, Requires Windows Scalable Network Pack (SNP) installed. Linux has no plan to support TOE at this time. Please refer to TOE_RDMA_iSCSI.doc for technology details. Internet Protocol version 6 (IPv6) is supported.

Ultra-Efficient Cooling

Strategically located fans, combined with efficient airflow paths, provide highly effective system cooling for the x3650 M2, known as Calibrated Vectored Cooling. The base server with one power supply includes three hot-swap fan packs, for redundant cooling. Each pack includes two back-to-back fans with counter-rotating blades for a total of 6 fans. In addition, each power supply also contains a fan.

The system contains three cooling zones. Zone 1 (incorporating one fan pack) cools all 16 DIMM sockets, Zone 2 (one fan pack) cools the primary processor, and Zone 3 (one fan pack) cools the second processor.

The fans automatically adjust speeds in response to changing thermal requirements depending on the zone and internal temperatures. When the temperature inside the server increases, the fans speed up to maintain the proper ambient temperature. When the temperature returns to a normal operating level, the fans return to their default speed. In addition, the Bosch BMP085 altimeter works in conjunction with IMM to govern fan rotation. At high altitudes the air is thinner and doesn’t cool as well as at lower elevations. In most servers, the fans run fast all the time to allow for use at high elevations, wasting power. The altimeter allows the IBM fans to run at lower speeds at lower altitudes.
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

Why not simply run the fans at 100% capacity all the time? For several good reasons: to reduce the ambient noise, reduce the wear-and-tear on the fans and reduce the server power draw. The reduction in ambient noise and power draw may be relatively minor for a single server, but put dozens or hundreds in a data center and it can make a big difference!

In addition, the server uses hexagonal ventilation holes in the chassis. Hexagonal holes can be grouped more densely than round holes, providing greater airflow through the system cover. This cooling scheme is important because newer, more powerful processors generate a significant amount of heat, and heat must be controlled for the system to function properly.

There are temperature sensors on the planar placed to sense DIMM exhaust temperature, SAS HDD exhaust temperature, and CPU2 exhaust temperature (through the altimeter).

Light Path Diagnostics
Light path diagnostics enables a technician to quickly identify and locate a failed or failing system component, such as a specific fan or memory DIMM. This enables quick replacement of the component, which helps increase server uptime and lower operating costs.

The front of the server has an LED indicator light to show possible component failures. If the front LED indicates an error condition, by pressing a button on the front of the server an LED panel will pop out and drop down for easy viewing without the need to open the server cover or remove the server from the rack. The light path diagnostics panel tells the servicer which component requires attention. In addition, many components have their own identifying LEDs. For example, each of the eight memory modules has an LED next to the socket, as do both processors, all adapter slots, all fans, all power supplies, the voltage regulator module and the service processor, allowing the servicer to easily identify exactly which component needs servicing. By following the “light path,” the component can be replaced quickly, and without guesswork. (Note: In the event of a failed DIMM, the system will restart and mark the DIMM as bad while offline, thus allowing the system to continue running, with reduced memory capacity, until serviced.)

Hot-Swap/Redundant Components
System availability is maximized through the extensive use of hot-swap and redundant components, including:

- Redundant memory protection (with memory mirroring enabled)
- Hot-swap, redundant hard disk drives (with RAID-1/10 protection standard and three other RAID levels optional)
- Hot-swap, redundant power supplies
- Hot-swap, redundant cooling fans

Other Features
- Four USB 2.0 ports — Provides flexibility to add high-speed external devices. The USB 2.0 specification supports up to 480Mbps transfer rates. (Note: Not all USB 2.0 devices are capable of achieving this rate.) Two ports are provided on the front of the server and four on the back. For pre-boot and normal drive use. 2 rear, 2 front
- Embedded hypervisor: a USB port on the motherboard, activated with optional 2GB USB key for supporting VMWare ESXi for virtualization (avail Q209)
- Virtual Media Key — This optional full-function systems management adapter adds local and remote management functions without consuming a valuable adapter slot.
- Dual video ports — A Matrox G200eV SVGA video controller provides up to 1024x768 resolution, with a color depth of 32 bits at 85Hz refresh rate. To simplify local systems management, one video port is provided on the front of the unit and one on the back.
- Toolless slides — Allows quick rack installation and quicker upgrade and servicing of the server.
- Toolless chassis — The cover can be opened without tools, and many components can be removed and replaced without tools, including the CD-RW/DVD combo drive, hot-swap drives, and PCIe adapters, as well as the integrated ServeRAID-BR10i and Virtual Media Key. This can save a servicer significant time.

Rack Cable Management and KVM Console Switching
IBM Advanced Cabling Technology (ACT) is an optional feature that offers many advantages over standard KVM cabling across the entire System x and xSeries product line. So now you can interconnect all of your servers with one smart cabling architecture. ACT cabling eliminates the need for one-to-one direct connections between each server and a KVM switch by using a daisy-chain approach.

Please see the Legal Information section for important notices and information.
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

The snarl of cabling behind most racks is at best inconvenient to work around and at worst an expensive logistical nightmare, requiring the rewiring of servers, PDUs, KVM switches, and other equipment whenever a rack server is added or removed. Even worse, the veil of cables blocks rack airflow and can actually contribute to equipment failure due to overheating. ACT cabling is the solution for reducing behind-the-rack cabling by as much as 87%.

The illustration below shows a sample ACT configuration:

Conventional cabling has bulky KVM cables exiting each server, which then connect to a KVM switch. The cables exiting a series of KVM switches must then be aggregated via additional KVM switches and PDUs, which only increases the number—and cost—of cables, KVM switches and PDUs. Instead, the daisy-chain approach of ACT cabling uses readily available, inexpensive CAT5 and 6 cabling to considerably reduce the number of cables, KVM switches, and PDUs needed, rather than increasing them. If a server is removed or added, no complicated rewiring is needed. One cable connects the first server in the rack to the next, and so on. Up to 16 servers form a chain; up to 8 chains can connect to one Local Console Manager (LCM); 16 LCMs can connect to one Global Console Manager (GCM). In this manner, up to 2,048 servers can be centrally managed. Equally importantly, with ACT—unlike some other offerings—everything is done externally via cabling; no special adapters are required.

Extensive System Support Features

The IBM services and technical support portfolio provides world-class, consistent, high-quality service and support. The x3650 M2 server offers a number of tools and services designed to make ownership a positive experience. From the start, IBM programs make it easier for you to plan for, configure and purchase System x or xSeries servers, get them running and keep them running long-term. These features include IBM Express Portfolio, IBM ServerProven®, IBM Standalone Solutions Configuration Tool, IBM System x and BladeCenter Power Configurator, IBM ServerGuide, IBM Systems Director Service and Support Manager, Product Customization Services and extensive technical support offerings.

The IBM ServerProven program provides the confidence that specific options and operating systems have been tested on the server and are officially supported to work together. It is updated frequently to ensure that the latest compatibility information is always at your fingertips.

The IBM Standalone Solutions Configuration Tool (SSCT) is a downloadable tool that simplifies the often complex chore of configuring a full rack of servers (including blade servers) and confirming that you have all the cables, power distribution units, KVM (keyboard, video and mouse) switch boxes and other components you need, as well as the proper airflow clearances, electrical circuits and other environmental conditions.

IBM System x and BladeCenter Power Configurator helps IT managers plan for data center power needs, by providing the following information for specific configurations of System x and BladeCenter systems: power input (watts), PDU sizing (amps), heat output (BTUs), airflow requirements through chassis (CFM), VA rating, leakage current (mA), and peak inrush current (amps).

IBM ServerGuide (installed from CD) simplifies the process of installing and configuring System x and xSeries servers. ServerGuide goes beyond mere hardware configuration by assisting with the automated installation of the Microsoft® Windows® Server 2000 and 2003 operating systems, device drivers and other system components, with minimal user intervention. (Drivers are also included for support of Novell NetWare, Red Hat Linux and SUSE LINUX.) This focus on
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

deployment helps you reduce both you total cost of ownership and the complexity that administrators and technical personnel face.

IBM Systems Director Service and Support Manager (previously called IBM Electronic Service Agent™) is an innovative “call home” feature that allows System x and BladeCenter servers to automatically report hardware problems to IBM support, which can even dispatch onsite service if necessary to those customers entitled to onsite support under the terms of their warranty or an IBM Maintenance Agreement. Electronic Service Agent resides on a server and provides electronic support and problem management capabilities through a highly secure electronic dialogue between your systems and IBM. It monitors networked servers for hardware errors and it can perform hardware and software inventories and report inventory changes to IBM. All information sent to IBM is stored in a highly secure database and used for improved problem determination.

Additional services include hardware warranty upgrades and factory-installed Product Customization Services (PCS), such as asset tagging, hardware integration, software imaging and operating systems personalization.

IBM offers extensive technical support by phone and via the Web. Support options include links to forums/newsgroups, problem submission, online shopping support, service offerings, device drivers for all IBM product lines, software downloads and even upcoming technical seminar worldwide schedules and registration. Also available are remote installation, configuration and usage support for System x and xSeries hardware and software, as well as onsite custom services to provide the level of expertise you require.

Advanced Systems Management Capabilities

The x3650 M2 has a high level of systems management capabilities that are well-suited to remote locations as well as to stand-alone environments. Features include UEFI, IMM, ToolsCenter, IBM Systems Director Active Energy Manager for x86, Automatic Server Restart, Wake on LAN® support, PXE support, text console redirect, Predictive Failure Analysis, IBM Systems Director and support for an optional Remote Supervisor Adapter II SlimLine.

The Integrated Management Module (IMM) provides industry-standard Intelligent Platform Management Interface (IPMI) 2.0-compliant systems management. It provides a number of important system functions, including:

- Monitoring of system and battery voltage, system temperature, fans, power supplies, processor and DIMM status
- Fan speed control
- Product ID and Family ID detection
- Highly secure remote power on/off
- System reset control
- NMI/SMI detection and generation
- System diagnostic LED control (power, HDD, activity, alerts, heartbeat)
- IPMI over LAN
- Serial Over LAN
- Proxy server support
- LAN messaging and alerting
- Text console redirection over LAN
- VLAN support
- Enhanced authentication and encryption algorithms (RMCP+, SHA-1, AES)
- Local update of BMC firmware
- Firmware firewall
- Support for IPMI v2.0 compliant management software (e.g., xCAT)
- Other mandatory and optional IPMI BMC functions

The IMM alerts IBM Systems Director to anomalous environmental factors, such as voltage and thermal conditions—even if the server has failed.

The x3650 M2 also supports an optional IBM Virtual Media Key for additional systems management capabilities, including:

- Predictive Failure Analysis for system fans
- Graphical console redirection over LAN
- Web-based out-of-band control
- Windows “blue screen” capture
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

- Remote virtual floppy and CD-ROM
- High-speed remote redirection of PCI video, keyboard and mouse
- SSL (Secure Socket Layer) and LDAP (Lightweight Directory Access Protocol) support

IBM developed IBM Systems Director Active Energy Manager to put control of system power-saving features at the fingertips of administrators. Active Energy Manager is designed to take advantage of new features, such as monitoring power usage and balancing the performance of the system according to available power input. It provides the ability to plan and predict power consumption based on your hardware configuration. It also helps enable you to reduce the infrastructure required for redundancy, by using fewer servers on smaller power feeds and potentially lowering your overall data center support costs. It does this by inventorying all components, then adding up the total power draw and tracking the usage. It also includes power management and capping features to help administrators manage or reduce power usage.

**Automatic Server Restart (ASR)** helps reduce downtime by restarting the server automatically in the event of a system lockup. ASR technology is a combination of hardware circuitry tied into the server’s system reset function and a device driver. As long as the server continues running, the ASR watchdog timer will keep being reset, but if the operating system crashes or the hardware freezes somehow the ASR software will be unable to reset the hardware timer. If the timer is not reset within five minutes, it automatically triggers the ASR hardware, which immediately restarts the server (and logs an ASR event with IBM Systems Director). These features are designed so that no more than five minutes can pass before the server is restarted.

**Wake on LAN** permits the server to be remotely powered on if it has been shut off. Once powered up, the server can be controlled across the network, using the Preboot Execution Environment (PXE).

Like Wake on LAN, PXE is system firmware. It enables software such as the optional IBM Remote Deployment Manager to take control of a system before the BIOS, operating system or applications are loaded (using Wake on LAN/PXE) and lets an administrator perform many low-level tasks remotely that would otherwise require a visit to each system. These tasks may include such things as formatting a hard disk drive, updating system firmware, or deploying a Windows or Linux operating system.

**Text Console Redirection** support allows the administrator to remotely view x3650 text messages over serial or LAN. An optional upgrade to the Virtual Media Key adds graphical console redirection.

**Predictive Failure Analysis (PFA)** is designed to allow the system to detect impending failure of supported components (memory, power supplies, hard disk drives, and fans) before actual failure, and alert the administrator through IBM Systems Director. This gives you the ability to replace the failing component before it fails, resulting in increased uptime.

**IBM Systems Director** software for advanced workgroup management is included with the x3650 M2. IBM Systems Director comes with a portfolio of tools, including Systems Director Active Energy Manager, and other tools. System Availability (a no-charge download) and Capacity Manager (sold separately) are available as add-ons for additional server management and increased availability. IBM Systems Director provides a single uniform graphical interface for all of these systems management functions.

IBM Systems Director enables you to customize thresholds and monitor system components (for things like temperature, voltage regulation, etc.) to help maximize uptime.

---

**Key Options**

IBM options for System x servers help you take your servers to a higher level

You know can rely on System x options to supply a complete solution for your business needs. Options help you create an optimized server system to meet your data protection, storage and availability needs. Every IBM option is designed and tested for peak performance and flexibility, helping to maximize your return on investment. The combination of System x servers and options lets you keep your fingers on the pulse of your e-business.

**Processors** — The Intel Xeon processor provides high clock rates, dual- or quad-cores, 64-bit extensions, a large cache and advanced features for availability and manageability. Large cache size, combined with fast 1333MHz or 1066MHz or 800MHz memory access and an integrated memory controller reduce memory latency and facilitates the movement of data. *(Note: System performance depends not only on the number of processors in the server but also on the power and functionality of each processor.)* Adding a second processor may be a cost-effective way to achieve significant performance improvements.

**Memory** — Memory is a significant factor in systems application performance. Adding more memory to a System x server is one of the most effective ways to increase application performance. For best performance in a server with a 4-core processor, there should be twice as much memory available as for a 2-core processor.
Leadership enterprise server with significantly lower cost of ownership in a highly available and
expandable, rack-dense, 2U dual-socket server

Hard Disk Drives — IBM hard disk drives help you improve the transaction and cost
performance of your System x servers. The choice of hard disk drives can be a critical aspect of
maximizing the I/O throughput of the system. SAS hard disk drives are available for the x3650
M2 with capacities up to 300GB (2.5-inch) apiece at 10,000 RPMs, up to 146.8GB (2.5-inch)
apiece at 10,000 or 15,000 RPMs, or up to 73.4GB apiece (2.5-inch) at 10,000 or 15,000 RPMs.

Solid State Drives — IBM offers 31.4GB and 50GB 2.5” solid-state drives as an alternative to
internal HDDs. They can be used as a highly available boot drive, for storing disk images, or for
other primarily read-only uses.

Power Supply — The optional second power supply for the x3650 M2 enables redundancy for
hot-swap power.

Virtual Media Key — The x3650 M2 includes a plethora of systems management features built-
in; however, sometimes additional management capability is needed. In those situations, the
Virtual Media Key not only offers powerful new features, it does so without taking up a valuable
PCI-X or PCIe adapter slot, instead using a dedicated connector on the motherboard.

ServeRAID Controllers — System x servers using ServeRAID-BR10i technology allow
companies to build a reliable foundation for business-critical computing. IBM ServeRAID
technology allows an array consisting of multiple physical hard disk drives to be treated as one
logical drive. ServeRAID technology also allows data to be stored redundantly, across multiple
hard disk drives—enhancing both the integrity and the availability of the data. SAS and SATA
ServeRAID controllers offer enhanced performance due to onboard processors and cache.
Because IBM ServeRAID controllers can help significantly improve data transfer rates, this
technology is extremely effective when implementing demanding, transaction-oriented
applications. By employing the advanced fault tolerance of IBM ServeRAID technology,
companies can effectively implement networked business systems that require large amounts of
storage space for data and applications that must be available for their businesses to continue
operating.

The optional ServeRAID-MR10i SAS/SATA controller offers enhanced performance over the
integrated ServeRAID-BR10i controller (SAS models), 256MB of battery-backed cache memory,
and supports six RAID levels: 0 (striping), 1 (mirroring), 10 (mirroring and striping), 1E (enhanced
mirroring, supporting odd numbers of drives), 5 (striping with parity), and 6 (striping with double
parity).

The optional ServeRAID-MR10is supports hardware based full disk encryption plus RAID-
0/1/10/1E/5/6 support.

The optional ServeRAID-MR10M SAS controller offers high performance and 256MB of cache
memory (with optional battery backup) for external SAS storage capacity. The adapter supports
five RAID levels: 0 (striping), 1 (mirroring), 10 (mirroring and striping), 5 (striping with parity), and
50 (striping/mirroring with parity).

External Storage — The IBM System Storage DS3000, DS4000, DS6000, and DS8000 series,
as well as the N3000, N5000, and N7000 series, comprise a powerful and broad shared storage
family with integrated management software designed to meet midrange and enterprise needs.
For lower-end needs, IBM offers the System Storage DS400 storage enclosures.

External SAN, iSCSI, and direct-attach storage is available using one of several IBM System
Storage and TotalStorage host bus adapters. Additionally, external LAN-attached tape storage is
available.

The iSCSI HBA Adapter for IXA Connectivity is a PCI adapter for selected System x and
xSeries servers that provides a direct 1GBps link to an IBM System i5 or iSeries server. This
connection enables you to centralize your Microsoft Windows and System i5 or iSeries storage
and consolidate the operations and backup of your System x, xSeries, System i5 and iSeries
systems into a single infrastructure. It enables the tightest possible integration between Windows
and System i5/iSeries data and applications, and allows as many as 32 servers to attach to one
System i5 or iSeries system to share the iSeries server’s systems management, DVD, tape and
disk storage via the iSeries dynamic virtual storage architecture. This can take the place of a SAN
if you have an established System i5 or iSeries infrastructure.

The Bottom Line

The IBM System x3650 M2 is an extremely energy efficient, powerful system, incorporating significantly redesigned management tools and abundant IBM-unique innovations:

Price/Performance

- High-throughput processors — 2.0 to 2.93GHz quad-core or 1.8GHz dual-core Xeon processors; up to 2 4-core or 2-core) processors total
- Energy-efficient low-voltage processors — 60W quad-core Xeon processors
- Large cache — 8MB or 4MB of L3 processor cache
- 64-bit extensions (EM64T)
- Fast memory — Registered PC3-10600 DDR III ECC DIMMs standard with two-way or four-way interleaving, operating at 1333MHz or 1066MHz or 800MHz (depending on processor model and memory configuration)
- Fast disk technology — Integrated SAS controller and slotless hardware-based RAID-0 data striping. RAID-10 striped/mirrored arrays uses a slot, or SATA controller (model-specific)
- Fast communications — Integrated dual Gigabit Ethernet controller standard supporting Jumbo Frames and TOE, two additional Gigabit Ethernet optional
- Fast I/O — Four PCIe x8 adapter slots (replaceable with two x16)

Flexibility

- Large memory capacity — Up to 128GB of registered DDR3 DIMMs, using 16 DIMM slots
- Up to twelve 2.5-inch hot-swap SAS/SATA/SSD drives; or simple-swap SSDs
- Choice of disk storage — Up to 3.6TB of internal SAS/SATA storage, 600GB of internal solid-state storage
- High-performance external expansion — Four 480Mbps USB 2.0 ports (two front, two rear)
- Hardware-based RAID-0/1/10 support or RAID support for RAID-1E/5/6 or full disk encryption with RAID-1E,5,6 or external storage
- Four available adapter slots —
  - Four x8 PCIe slots (Gen2)
  - An optional riser card containing two 133MHz PCI-X slot can replace each of the two riser cards
- Integrated DVD/CD-RW combo drive
- Two video ports (one on the front and one on the back)
- Optional iSCSI HBA Adapter for IXA Connectivity (to System i® servers)

Manageability, Serviceability and Availability

- IBM Systems Director systems management software, including:
  - IBM Systems Director Active Energy Manager
  - IBM Management Processor Assistant
  - IBM Rack Manager
  - IBM RAID Manager
  - IBM Update Assistant
  - IBM Software Distribution
  - IBM System Availability
- Integrated Management Module (IMM):
  - IPMI 2.0 compliance, including highly secure remote power control
  - Text console redirection systems management standard
- Active Memory protection:
  - Advanced Chipkill ECC memory protection (optional),

Please see the Legal Information section for important notices and information.
Leadership enterprise server with significantly lower cost of ownership in a highly available and expandable, rack-dense, 2U dual-socket server

- Memory mirroring
  - Slotless hardware-based ServerRAID-BR10i disk mirroring; RAID 1, 5, 6, 10, 50; uses PCIe slot
- Hot-swap SAS/SATA/SSD drives or simple-swap SSD drives
- Ultra-efficient cooling incorporating Calibrated Vectored Cooling features and hot-swap/redundant fans
- Optional hot-swap/redundant power supplies
- Light path diagnostics (front LED panel, drop-down light path panel)
- Optional Virtual Media Key daughter card (no slot required)
- Supports LDAP and SSL industry standards
- Toolless chassis and toolless slide design; integrated Cable Management Arm

IBM provides these links merely as a convenience and the inclusion of such links does not imply an endorsement.

Information in this presentation concerning non-IBM products was obtained from the suppliers of these products, published announcement material or other publicly available sources. IBM has not tested these products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

MB, GB and TB = 1,000,000, 1,000,000,000, and 1,000,000,000,000 bytes, respectively, when referring to storage capacity. Accessible capacity is less; up to 3GB is used in service partition. Actual storage capacity will vary based upon many factors and may be less than stated.

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will depend on considerations such as the amount of multiprocessing in the user's job stream, the I/O configuration, the storage configuration and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

Maximum internal hard disk and memory capacities may require the replacement of any standard hard drives and/or memory and the population of all hard disk bays and memory slots with the largest currently supported drives available. When referring to variable speed CD-ROMs, CD-Rs, CD-RWs and DVDs, actual playback speed will vary and is often less than the maximum possible.
